With the help of these machines and the program TSG, the players can play the games that are actually on CD without having to copy them from CD. In the list below are all the different sources of the game: cdromimages - download CD images from the internet. A lot of games are available. Old games of MS DOS, Linux and Unix. vintagesoftware - Direct download of game files for Windows. You get the game CD, the game files, the config files and a lot of other files. Once you download it, you extract the contents of the zip archive to a place you want and run vintagesoftware. Artstation - Same as vintagesoftware, but with better versions of games. Artstation has just a few games compared to vintagesoftware, but is free. Artstation also supports more than DOS and Linux. Authoring System - A program to read and write game CDs, once you have a copy of a game CD. TSG - The tools that combine the virtual machines together.
